

```

class Point
{
private:
    int x;
    int * y; //pointer
}

```

shallow copy

Note:-as we can see in above the case if we modify the value of p2.y, then value at p1.y is also getting affected(modified).as both the obj p1 and p2 data member y is holding an address of same dynamic memory.

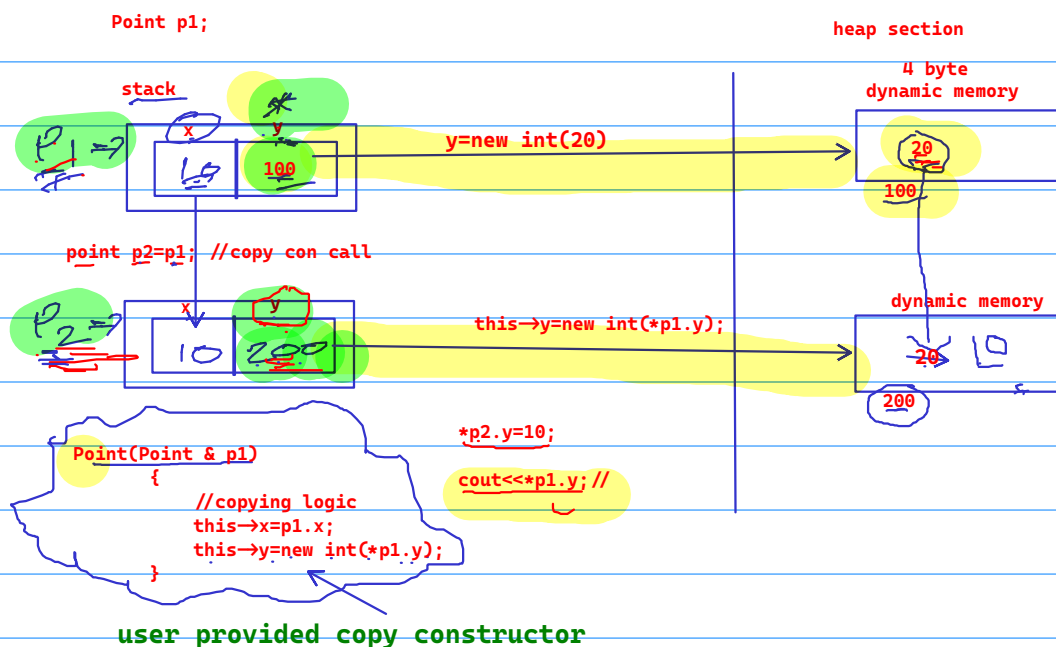

```

class Point
{
private:
    int x;
    int * y; //pointer
}

```

Q. If we modify the value at P2.y then it should not modify the value at p1.y?

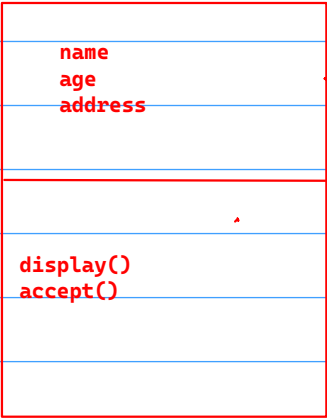

deep copy

Inheritance

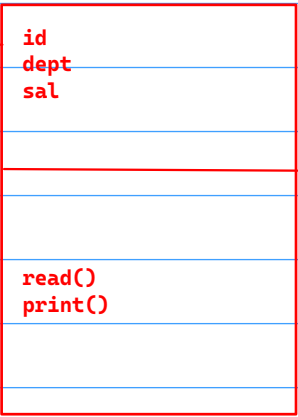

parent class/ base class

Person class

child class/derived class

Employee class

is-a

class Employee: public Person
